A tray device which goes over and between the legs for raising and supporting human testes during ultrasound inspection, to assist in immobilizing same to improve ultrasonic imaging, adapted for use when the patient is in a supine position. A pair of spaced-apart downwardly curved members are provided, having a curvature approximating the curvature of a leg of a patient proximate the thigh area. Intermediate each of said curved members is a support member, which is of a narrow width to permit positioning of such support member beneath the testes of a male patient and between the legs of a patient to raise and support such testes to permit ultrasonic examination of such testes. The device may be a unitary one-piece construction, preferably of a moulded plastic, which also facilitates easy sterilization to permit re-use of the device on subsequent patients.
